

Feedback:

River discharge include!! Dawg group (see relevant comment), minimal ground based more just to compare, double check page 2 doppler para!! Also in that paragraph!! Has more issues for example local weather !! Move focus on the satellite being independent of weather and time of day, separate altimetry to our method, on ground Doppler altimetry!!!!, page 2 !! Double check, global coverage note - theres tracking windows! Look at poles!! Think of orbit angles, double check orbit angles and also its turned on and off, these are tracking windows, power budgets, - improves from traditional altimetry. Layover (include in page 3 rivers, briefly mention cus of valleys!) page 3 interferometry improves cross track ! Altimetry can be better for narrow rivers instead of swot/ sar (side facing) due to layover. NOT designed for river velocity estimation, no access to level 1a, only level 1b and again in con

Future Work:

So far i think expand on the swot detail and go over the ref charlie sent for further understanding!!
